

## Manufacturing Information

Cambridge University Press takes advantage of the most up-to-date printing technologies to ensure both quality and speed to market. Your book may be produced via one of the following routes.

**Lithographic** – the best quality printing that is currently available. This type of printing is suitable for books that have a large number of critical images, such as medical books, as the result of the printed product is very clear.

**Inkjet** – a good, less expensive alternative to lithographic printing which is better suited for books with few or no images. Titles that are printed inkjet can potentially be printed under the distributed print model. This model allows stock to be printed in both the UK and the US at the same time, resulting in a fast speed to market with books being published in the UK and US at the same time.

**Print on Demand** – no stock is held and the product is printed at the nearest available location to the customer, helping them receive their order within 48 hrs of ordering.

Most of our titles are printed in mono (black and white). If there are just a handful of colour images, it is best to print the book in mono and include the images in a colour plate section. Alternatively, if the book contains a lot of colour images, the entire product can be printed in colour.
